

## How to find Device Name

Knowing your computer's name and what version of Windows it runs (Home or Pro) is important in general home networking, and especially when you're asking for technical help. Here's how to quickly find your computer's name on Windows 8 and 10:

1. **Right click** on the **Start button** 
2. In the pop-up menu, click on **System**

The System window will appear and display basic information about your computer, including Windows edition, processor, and amount of system memory, system type (64-bit or 32-bit) and of course the name of the computer. Note that the full computer name, which is only relevant in a corporate-type network, will include the domain name.

A screenshot of the Windows Settings application, specifically the 'About' page. The left sidebar shows the 'System' category selected. The main content area displays 'Device specifications' and 'Windows specifications'.

Device specifications	
Device name	DESKTOP-8DGNCKM
Processor	Intel(R) Core(TM) i5-3320M CPU @ 2.60GHz 2.60 GHz
Installed RAM	4.00 GB
Device ID	2ADAF2A0-F19B-432E-B4D7-244AB8186584
Product ID	00330-50000-00000-AAOEM
System type	64-bit operating system, x64-based processor
Pen and touch	No pen or touch input is available for this display
